

AMENDMENTS TO THE CLAIMS

(IN FORMAT COMPLIANT WITH THE REVISED 37 CFR 1.121)

1. (CURRENTLY AMENDED) An apparatus comprising:

a bus;

a first data modification circuit configured to generate
a first output data stream in response to performing a first
5 modification on at least one first image from a first input data
stream received from said bus; and

a composite circuit configured to generate a combined
output data stream on said bus in response to performing a spatial
combination of said first output data stream and a second output
10 data stream.

2. (PREVIOUSLY PRESENTED) The apparatus according to
claim 1, wherein said apparatus forms a block modify and move
engine.

3. (PREVIOUSLY PRESENTED) The apparatus according to
claim 1, further comprising:

a second data modification circuit configured to generate
said second output data stream in response to performing a second
5 modification on at least one second image from a second input data
stream.

4. (PREVIOUSLY PRESENTED) The apparatus according to claim 1, wherein said first data modification circuit is further configured to convert an input format of said first input data stream and an output format of said first output data stream
5 between a video data format and a graphics data format.

5. (PREVIOUSLY PRESENTED) The apparatus according to claim 1, wherein (i) said first output data stream comprises a plurality of video pictures, (ii) said second output data stream comprises a graphics data and (iii) said spatial combination places
5 said video pictures in front of said graphics data.

6. (CANCELED)

7. (PREVIOUSLY PRESENTED) The apparatus according to claim 1, wherein said first data modification circuit is further configured to perform interleaving of color components in each of said first images.

8. (PREVIOUSLY PRESENTED) The apparatus according to claim 1, wherein said first data modification circuit is further configured to perform separation of color components in each of said first images.

9. (PREVIOUSLY PRESENTED) The apparatus according to claim 1, wherein said first data modification circuit is further configured to perform scaling on each of said first images.

10. (PREVIOUSLY PRESENTED) The apparatus according to claim 1, wherein said first data modification circuit is further configured to perform filtering on each of said first images.

11. (PREVIOUSLY PRESENTED) The apparatus according to claim 1, wherein said spatial combination is a bitwise logical operation on said first output data stream and said second output data stream.

12. (PREVIOUSLY PRESENTED) The apparatus according to claim 1, wherein said spatial combination is an alpha blending on said first output data stream and said second output data stream.

13. (CURRENTLY AMENDED) A method for processing a plurality of data streams, comprising the steps of:

(A) reading a first input data stream of said data streams from a memory;

5 ~~(A)~~ (B) modifying at least one image from a said first input data stream ~~of said data streams~~ to generate a first output data stream of said data streams; ~~and~~

~~(B)~~ (C) spatially combining said first output data stream
and a second output data stream of said data streams to generate a
10 combined output data stream; and

(D) writing said combined output data stream to said
memory.

14. (CURRENTLY AMENDED) The method according to claim
13, wherein step ~~(A)~~ (B) further comprises the sub-step of:

converting an input format of said first input data
stream and an output format of said first output data stream
5 between a video data format and a graphics data format.

15. (CURRENTLY AMENDED) The method according to claim
13, wherein (i) said first output data stream comprises graphics
data, (ii) said second output data stream comprises a plurality of
video pictures and (iii) said step ~~(B)~~ (C) further comprises the
5 sub-step of:

spatially placing said graphics data in front of said
video pictures.

16. (CURRENTLY AMENDED) The method according to claim
13, wherein step ~~(A)~~ (B) further comprises the sub-step of:

interleaving of color components in each of said images.

17. (CURRENTLY AMENDED) The method according to claim 13, wherein step ~~(A)~~ (B) further comprises the sub-step of:
separating of color components in each of said images.

18. (CURRENTLY AMENDED) The method according to claim 13, wherein step ~~(A)~~ (B) comprises the sub-steps of:
scaling each of said images; and
filtering each of said images.

19. (CURRENTLY AMENDED) The method according to claim 13, wherein step ~~(B)~~ (C) comprises the sub-step of:
performing bitwise logical operations on said first output data stream and said second output data stream.

5

20. (CURRENTLY AMENDED) The method according to claim 13, wherein step ~~(B)~~ (C) comprises the sub-step of:
performing alpha blending on said first output data stream and said second output data stream.

21. (PREVIOUSLY PRESENTED) The apparatus according to claim 1, further comprising:
a memory configured to buffer a first data having a first format, a second data having a second format and a third data;

5 a first expander circuit configured to generate said first input data stream having a particular format from said first data;

 a second expander circuit configured to generate said second output data stream having said particular format from said
10 second data; and

 a third expander circuit configured to generate a control signal for said spatial combination from said third data.

22. (CURRENTLY AMENDED) An apparatus comprising:

a means for storing;

means for generating a first output data stream by modifying at least one image from a first input data stream read
5 from said means for storing; and

means for generating a combined output data stream by spatially combining said first output data stream and a second output data stream read from said means for storing; and

means for writing said combined output data stream to
10 said means for storing.
